CPA. Handling a large graph

Maximilien Danisch

1 To get things started

Exercise 1 — *Preparation* Download the following graphs:

- `http://snap.stanford.edu/data/com-Amazon.html`
- `http://snap.stanford.edu/data/com-LiveJournal.html`
- `http://snap.stanford.edu/data/com-Orkut.html`
- `http://snap.stanford.edu/data/com-Friendster.html`

All these graphs will enable you to check the results of your programs.

You can, in addition, create (manually) a few small graphs and store them in files where each line is of the form:
u v
which indicates that a link exists between nodes u and v.
Make a program that counts the number of nodes and edges in a graph and writes this value on the standard output. Test it on the 4 downloaded graphs.

2 Load a graph in memory

Exercise 2 — *Three graph datastructures* Make three programs to read a graph and store it in memory:

1. as a list of edges,
2. as an adjacency matrix,
3. as an adjacency array.

Note that these three programs are important as they will be used in the future practicals. Make sure to have them working fine.
Use them on the 4 downloaded graphs and conclude on the scalability of the three programs.

3 Breadth-first search and diameter

Exercise 3 — *BFS* Implement an efficient BFS algorithm.
Use your BFS algorithm to make an algorithm that computes a good lower-bound (and upper-bound) to the diameter of a graph.
Test your algorithm on the 4 downloaded graphs and report your lower bound as well as the running time of your algorithm.

4 Listing triangles

Exercise 4 — *Triangles* Implement an efficient algorithm for listing triangles.
Test your algorithm on the 4 downloaded graphs. For each graph, report the number of triangles as well as the running time of your algorithm.
